Weka

Weka Toolkit

- <http://www.cs.waikato.ac.nz/ml/weka/>

Developed in Java and Open source

- GNU Licence

Well supported by the community through mailing lists and Wiki:

- <http://weka.wikispaces.com/>

Also, supported commercially by Pentaho

- <http://weka.pentaho.com/>
- Acknowledgement: J Hernandez & C Ferri (UPV) for some some examples

Weka Toolkit

Composed of several tools

- GUI Chooser
 - Package manager, Visualisation and Viewers
- Explorer (the one to use most of the time)
- Experimenter
- KnowledgeFlow
- SimpleCLI
 - (Command Line Interface) - Obsolete

ARFF, XRFF, and sparse formats

ARFF (Attribute-Relation File Format) is Weka's native file format

- Composed of Header and Data
 - Header of the ARFF file contains the name of the relation, a list of the attributes (the columns in the data), and their types (numeric, nominal, date).
 - Data is composed of comma separated values after @data

XRFF (eXtensible attribute-Relation File Format) is an XML-based extension of the ARFF format. It has the advantage of the following additional capabilities:

- class attribute specification
- attribute weights (So far, only Naïve Bayes can handle attribute weights)
and instance weights are also supported in ARFF de
- It can be compressed using the xrff.gz extension

Both ARFF and XRFF formats support sparse data when most data values are zeros

- (e.g. supermarket dataset)

ARFF Example

@relation weather % Comment

@attribute outlook {sunny, overcast, rainy}

@attribute temperature real

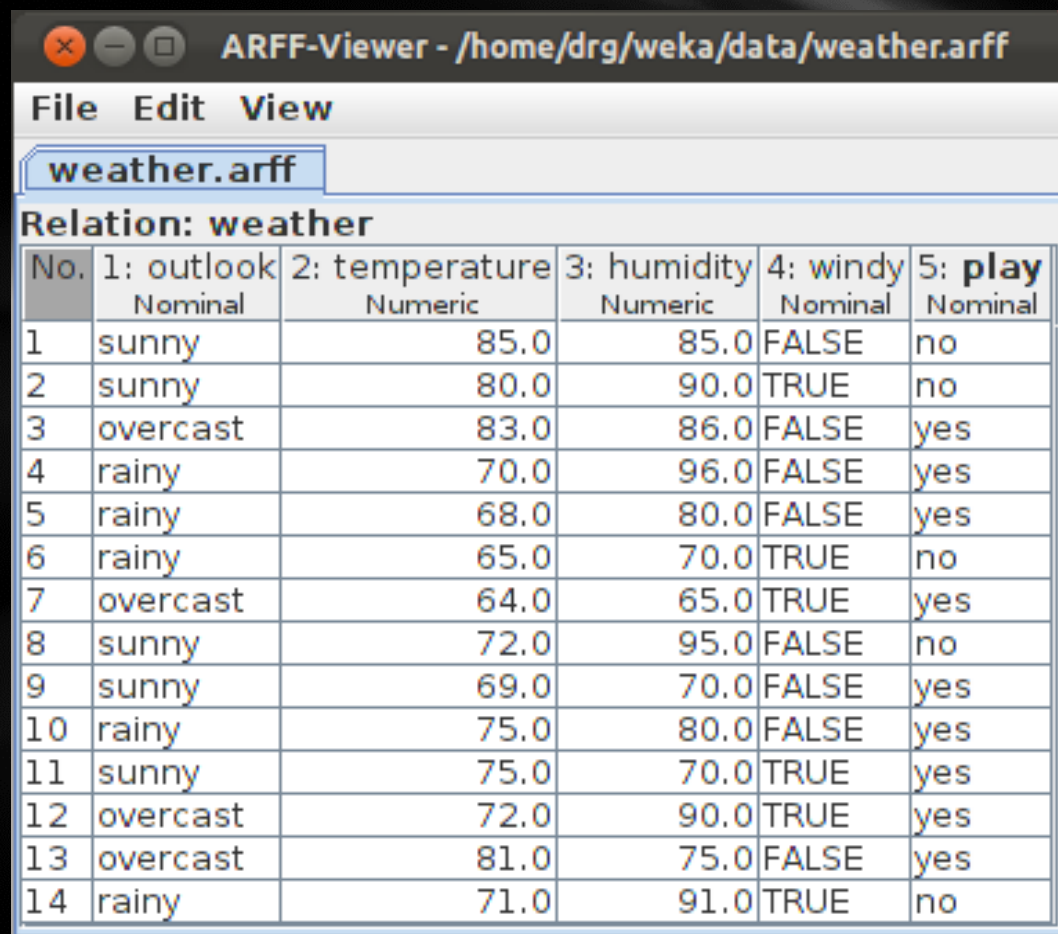

@attribute humidity real

@attribute windy {TRUE, FALSE}

@attribute play {yes, no}

@data

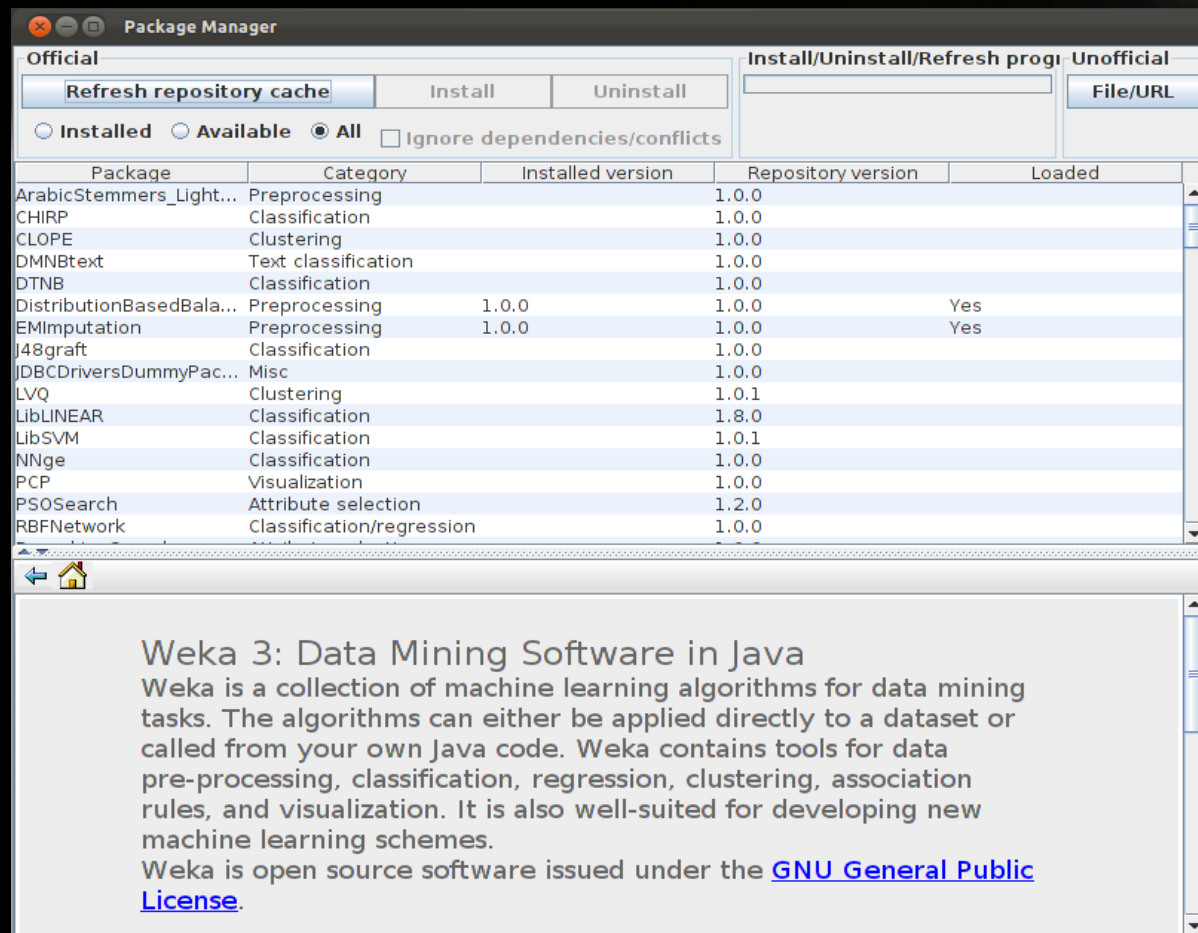

sunny,85,85,FALSE,no
sunny,80,90,TRUE,no
overcast,83,86,FALSE,yes
rainy,70,96,FALSE,yes
rainy,68,80,FALSE,yes
rainy,65,70,TRUE,no
overcast,64,65,TRUE,yes
sunny,72,95,FALSE,no
sunny,69,70,FALSE,yes
rainy,75,80,FALSE,yes
sunny,75,70,TRUE,yes
overcast,72,90,TRUE,yes
overcast,81,75,FALSE,yes
rainy,71,91,TRUE,no

No.	1: outlook Nominal	2: temperature Numeric	3: humidity Numeric	4: windy Nominal	5: play Nominal
1	sunny	85.0	85.0	FALSE	no
2	sunny	80.0	90.0	TRUE	no
3	overcast	83.0	86.0	FALSE	yes
4	rainy	70.0	96.0	FALSE	yes
5	rainy	68.0	80.0	FALSE	yes
6	rainy	65.0	70.0	TRUE	no
7	overcast	64.0	65.0	TRUE	yes
8	sunny	72.0	95.0	FALSE	no
9	sunny	69.0	70.0	FALSE	yes
10	rainy	75.0	80.0	FALSE	yes
11	sunny	75.0	70.0	TRUE	yes
12	overcast	72.0	90.0	TRUE	yes
13	overcast	81.0	75.0	FALSE	yes
14	rainy	71.0	91.0	TRUE	no

Package Manager (version > 3.7.2)

Just the most common algorithms are included with the download but others can be installed via the Package Manager.

Explorer

The one to use most of the time. It can be used to find the most appropriate algorithm and parameters for a given dataset (usually trial & error approach)

The screenshot shows the Weka Explorer window with the 'weather' dataset loaded. The 'Classify' tab is active. The 'Selected attribute' is 'outlook', which is a nominal attribute with 3 distinct values and 0 missing values. The 'Class' is 'play (Nom)'. The interface includes a table of attributes, a table of selected attribute statistics, and a visualization area showing three stacked bar charts for the 'outlook' attribute.

Weka Explorer

Attributes: 5
Sum of weights: 14

Attributes

No.	Name
1	<input checked="" type="checkbox"/> outlook
2	<input type="checkbox"/> temperature
3	<input type="checkbox"/> humidity
4	<input type="checkbox"/> windy
5	<input type="checkbox"/> play

[All] [None] [Invert] [Pattern]

[Remove]

Selected attribute
Name: outlook
Missing: 0 (0%)
Distinct: 3
Type: Nominal
Unique: 0 (0%)

No.	Label	Count	Weight
1	sunny	5	5.0
2	overcast	4	4.0
3	rainy	5	5.0

Class: play (Nom) [Visualize All]

Visualization: Three stacked bar charts for 'outlook'. Each chart has a red top half and a blue bottom half. The first chart (sunny) has a total height of 5. The second chart (overcast) has a total height of 4. The third chart (rainy) has a total height of 5.

Status: OK [Log] x 0

Explorer's panels

Explorer has 6 panels to analyse and prepare data:

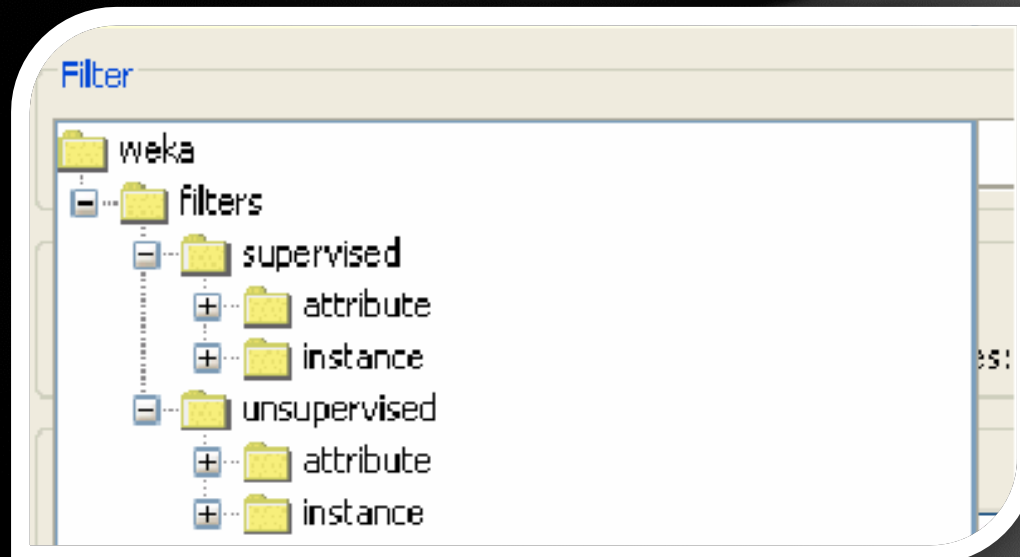

- **Preprocess:** Tools and filters for data manipulation
- **Classification:** Classification and regresión techniques
- **Cluster:** Clustering techniques
- **Associate:** Association techniques
- **Select Attributes:** Permite aplicar diversas técnicas para la reducción del número de atributos
- **Visualize:** Visualisation techniques
- **Other panels** can be added (e.g., Time series analysis)

Preprocess Panel

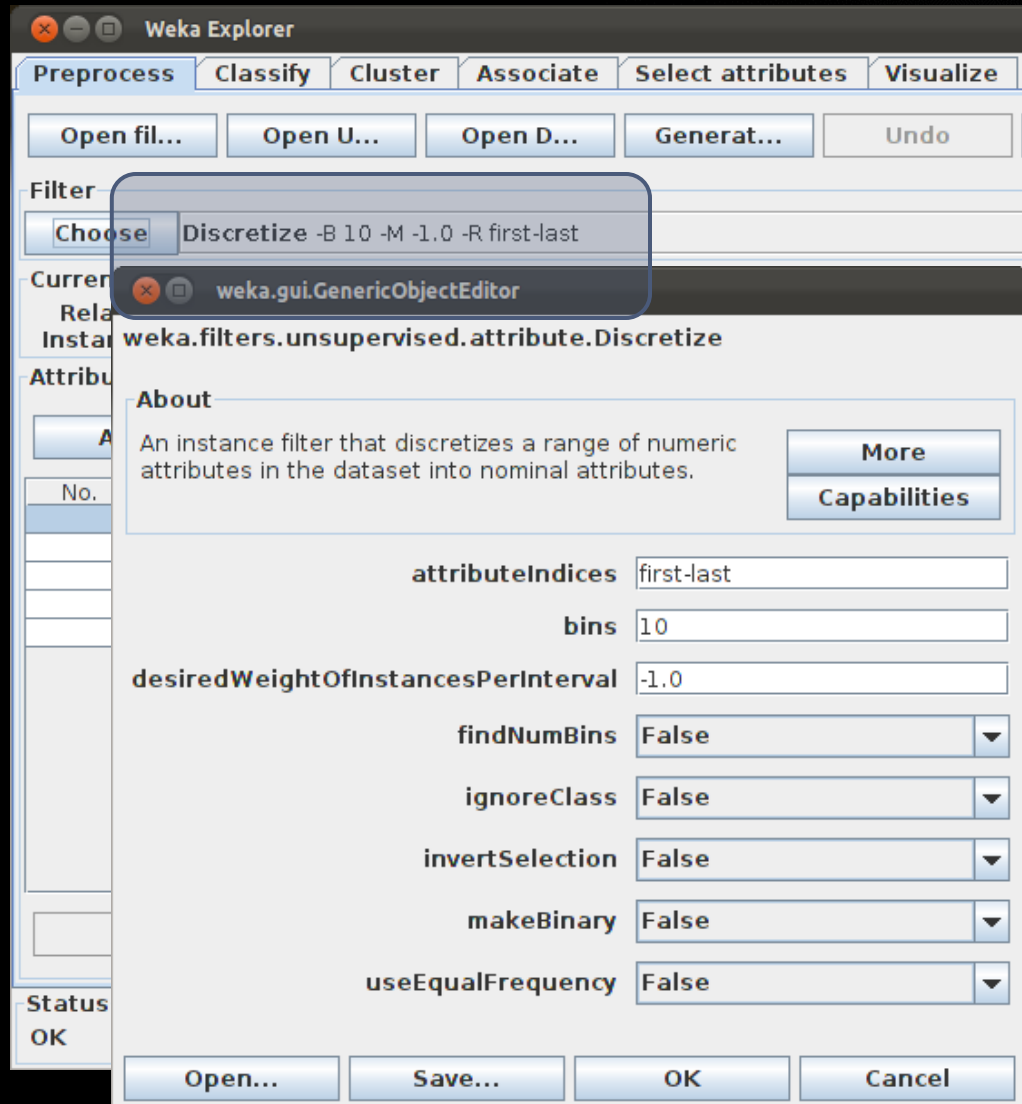

Filter algorithms are classified as

- Supervised – if the filter takes into account the class
- Unsupervised – otherwise
- An in turn they are also classified according to whether the filter applies to instances or attributes

Filter examples include discretisation (can be supervised or unsupervised, attribute selection (we will cover this one later in detail), etc.

Unsupervised Discretize Filter Example

Information

NAME
weka.filters.unsupervised.attribute.Discretize

SYNOPSIS
An instance filter that discretizes a range of numeric attributes in the dataset into nominal attributes. Discretization is by simple binning. Skips the class attribute if set.

OPTIONS

attributeIndices -- Specify range of attributes to act on. This is a comma separated list of attribute indices, with "first" and "last" valid values. Specify an inclusive range with "-". E.g: "first-3,5,6-10,last".

bins -- Number of bins.

desiredWeightOfInstancesPerInterval -- Sets the desired weight of instances per interval for equal-frequency binning.

findNumBins -- Optimize number of equal-width bins using leave-one-out. Doesn't work for equal-frequency binning

ignoreClass -- The class index will be unset temporarily before the filter is applied.

invertSelection -- Set attribute selection mode. If false, only selected (numeric) attributes in the range will be discretized; if true, only non-selected attributes will be discretized.

makeBinary -- Make resulting attributes binary.

useEqualFrequency -- If set to true, equal-frequency binning will be used instead of equal-width binning.

Discretize Supervised Filter Example

The image shows a screenshot of the Weka Explorer interface with the 'Preprocess' tab selected. The 'weka.gui.GenericObjectEditor' window is open, displaying the configuration for the 'weka.filters.supervised.attribute.Discretize' filter. The configuration includes:

- attributeIndices:** first-last
- invertSelection:** False
- makeBinary:** False
- useBetterEncoding:** False
- useKononenko:** False

Buttons at the bottom of the configuration window include 'Open...', 'Save...', 'OK', and 'Cancel'. The status bar at the bottom indicates 'Status OK'.

An 'Information' dialog box is also open, providing details about the filter:

NAME
weka.filters.supervised.attribute.Discretize

SYNOPSIS
An instance filter that discretizes a range of numeric attributes in the dataset into nominal attributes. Discretization is by Fayyad & Irani's MDL method (the default).

For more information, see:

- Usama M. Fayyad, Keki B. Irani: Multi-interval discretization of continuousvalued attributes for classification learning. In: Thirteenth International Joint Conference on Artificial Intelligence, 1022-1027, 1993.
- Igor Kononenko: On Biases in Estimating Multi-Valued Attributes. In: 14th International Joint Conference on Artificial Intelligence, 1034-1040, 1995.

OPTIONS

- attributeIndices** -- Specify range of attributes to act on. This is a comma separated list of attribute indices, with "first" and "last" valid values. Specify an inclusive range with "-". E.g: "first-3,5,6-10,last".
- invertSelection** -- Set attribute selection mode. If false, only selected (numeric) attributes in the range will be discretized; if true, only non-selected attributes will be discretized.
- makeBinary** -- Make resulting attributes binary.
- useBetterEncoding** -- Uses a more efficient split point encoding.
- useKononenko** -- Use Kononenko's MDL criterion. If set to false uses the Fayyad & Irani criterion.

'Classify' Panel – Rules

We can generate rules from trees or there are other algorithms to generate rules directly

'Classify Panel – Regression trees (M5P)

Lazy Techniques

Lazy techniques (also known as Collaborative Filtering or Instance-based Learning) do not build models, just retain instances.

Once a new instance needs to be classified, these techniques search for 'similar' instances in the repository

Weka's IBk implements k-NN.

- Weka's IBk uses the Euclidean distance by default.
- The sum of the squared differences between normalized attribute values is computed; this is then normalized by the number of attributes in the data; finally the square root is taken.
- Following this, weighting can be applied to the distances (if selected).
 - Normalising distances for all attributes so that attributes have the same impact on the distance function.
- It may return k neighbours. If there are ties in the distance, neighbours are voted to form the final classification.

Attribute Selection

Feature selection is important in different ways:

- A reduced volume of data allows different data mining or searching techniques to be applied.
- Irrelevant and redundant attributes can generate less accurate and more complex models. Furthermore, data mining algorithms can be executed faster.
- We can avoid the collection of data for those irrelevant and redundant attributes in the future.

There exist two major approach in feature selection from the method's output point of view depending on the way that features are evaluated:

- **Feature ranking**, a.k.a. feature weighting, assesses individual features and assigns them weights according to their degrees of relevance
- **Feature subset selection (FSS)** evaluate the goodness of each found feature subset (Unusually, some search strategies in combination with subset evaluation can provide a ranked list).

Feature Ranking

Feature ranking algorithms category, one can expect a ranked list of features which are ordered according to evaluation measures

Each attribute correlation with the class is evaluated independently of other attributes according to a statistical test (e.g.: χ -squared, Infogain, etc.)

- A subset of features is often selected from the top of a ranking list. A feature is good and thus will be selected if its weight of relevance is greater than a user-specified threshold value,
- or we can simply select the first k features from the ranked list.

This approach is efficient for high-dimensional data due to its linear time complexity in terms of dimensionality

Very fast method.

However, it cannot detect redundant attributes

Feature Subset Selection (FSS)

In the FSS category, candidate subsets are generated based on a certain search strategy:

- **Exhaustive, heuristic and random search**

Each candidate subset is evaluated by a certain **evaluation measure**. If a new subset turns out to be better, it replaces the previous best subset. The process of subset generation and evaluation is repeated until a given stopping criterion is satisfied. Existing evaluation measures include:

- Consistency measure attempts to find a minimum number of features that separate classes as consistently as the full set of features can. An inconsistency is defined as to instances having the same feature values but different class labels.
- Correlation measure evaluates the goodness of feature subsets based on the hypothesis that good feature subsets contain features highly correlated to the class, yet uncorrelated to each other.
- Accuracy of a learning algorithm (Wrapper-based attribute selection) uses the target learning algorithm to estimate the worth of attribute subsets. The feature subset selection algorithm conducts a search for a good subset using the induction algorithm itself as part of the evaluation function.

The time complexity in terms of data dimensionality is, exponential for exhaustive search, quadratic for heuristic search and linear to the number of iterations in a random search

FSS – CFS (Correlation Based FS)

Correlation measure is applied in an algorithm called CFS that exploit heuristic search (best first) to search for candidate feature subsets.

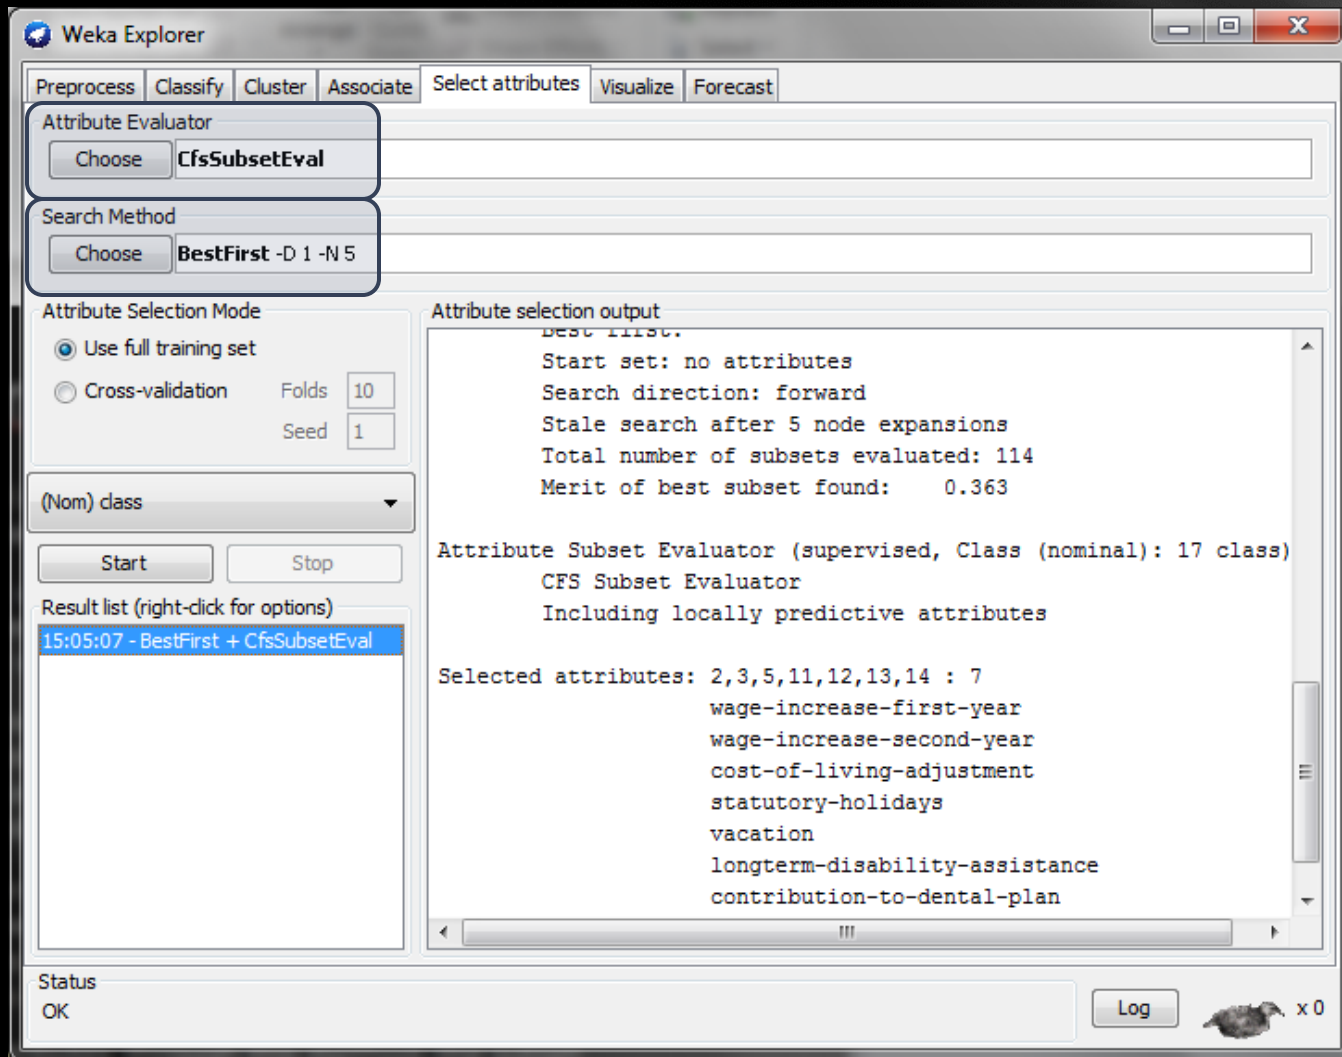

- One of the most frequently used search techniques is hill-climbing (greedy). It starts with an empty set and evaluates each attribute individually to find the best single attribute.

It then tries each of the remaining attributes in conjunction with the best to find the most suited pair of attributes. In the next iteration, each of the remaining attributes are tried in conjunction with the best pair to find the most suited group of three attributes.

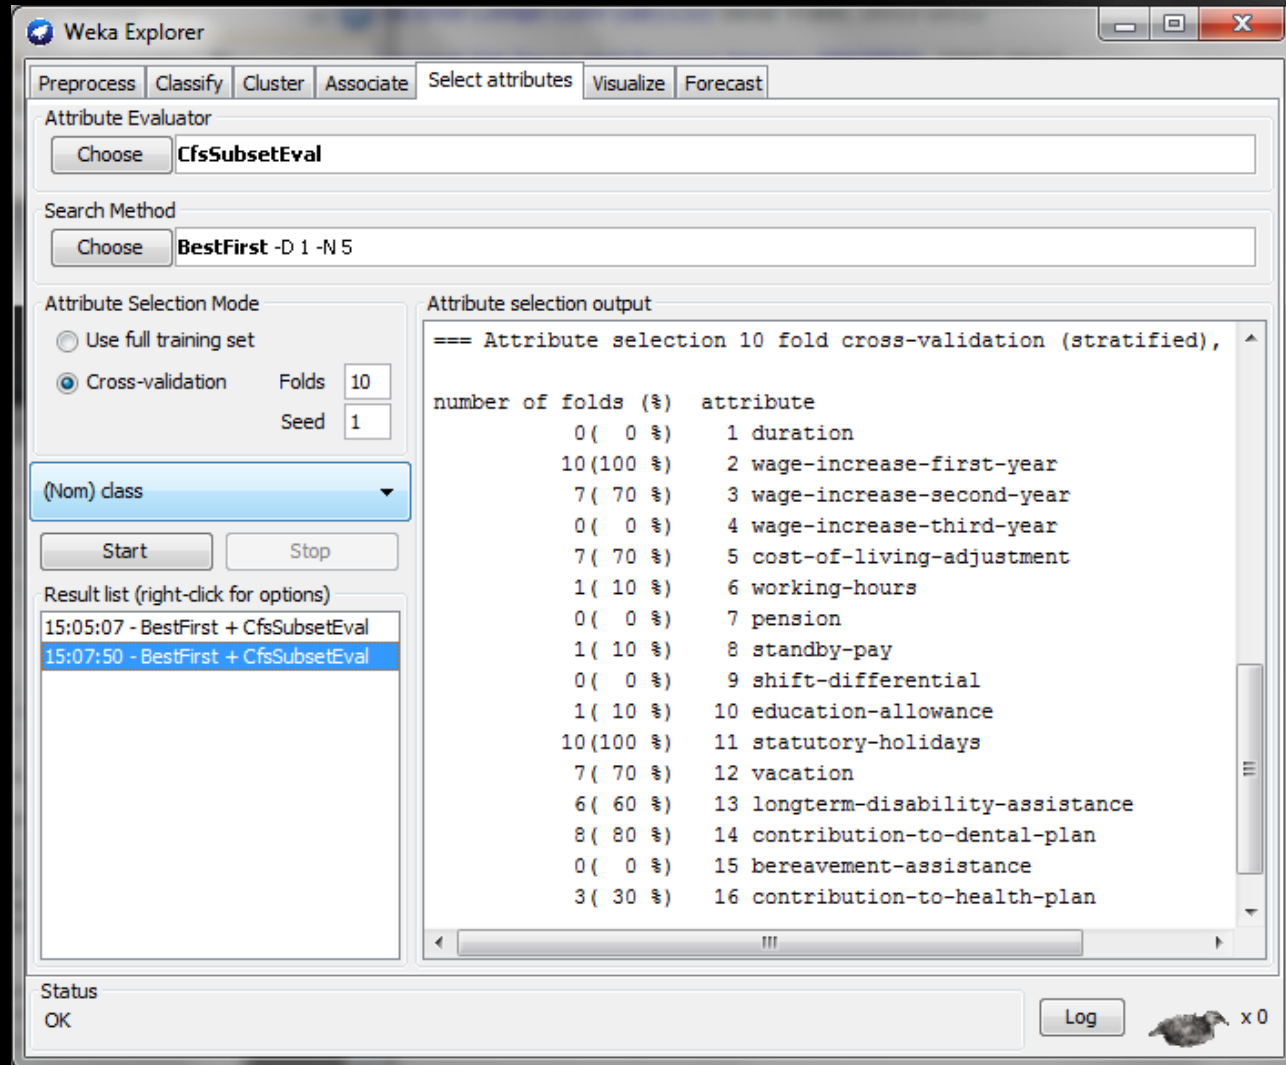

This process continues until no single attribute addition improves the evaluation of the subset; i.e., subset evaluator is run M times to choose the best single attribute, $M-1$ times to find the best pair of attributes, $M-2$ times the best group of three, and so on.

- E.g., if we have chosen 5 attributes through this method, the subset evaluator has been run $M+(M-1)+(M-2)+(M-3)+(M-4)$ times.

CFS Example

Exercise - Hay fever

Find the best possible model to recommend the type of drug for hay fever depending on the patient. The attributes collected from historical patients include:

- Age
- Sex
- BP Blood Pressure
- Cholesterol level
- Na: Blood sodium level
- K: Blood potassium level
- There are 5 possible drugs: DrugA, DrugB, DrugC, DrugX, DrugY

The dataset can be downloaded from:

- <http://www.cc.uah.es/drg/courses/datamining/datasets.zip>

Hints:

- Try C4.5, can you simplify the generated tree combining attributes?
- Naive Bayes: can you improve the 'default' results with Feature Selection?

Exercise – Cost Sensitive Example

Using the German credit dataset:

<http://www.cc.uah.es/drg/courses/datamining/datasets.zip>

This dataset is composed of 20 attributes (7 numeric and 13 nominal) of clients of a bank requesting a credit.

Please, check for details of the in the file itself, including the provided cost matrix:

predicted	actual	
	good	bad
	good	bad
	0	1
	5	0

This cost matrix means that it is 5 times more costly to give credit to a person that won't pay back than the other way around.

Check what happens with ZeroR, Naïve Bayes, Bagging

Association Rules and dependencies

The Titanic dataset (titanic.arff) is composed of 4 attributes

- Class (1st, 2nd, 3rd)
- Age (adult, child)
- Sex (male, female)
- Survived (yes, no)

describing the actual characteristics of the 2,201 passengers of The Titanic (*"Report on the Loss of the 'Titanic' (S.S.)" (1990), British Board of Trade Inquiry Report_ (reprint), Gloucester, UK: Allan Sutton Publishing*)

Using the Apriori algorithm extract information contained in this dataset

- Modify the default parameters to obtain rules that consider 'child' in the Age attribute. As there is a small number of values containing samples of age = 0, those rules are filtered out with due to their low coverage

Exercise – Clustering

Using the employees dataset:

<http://www.cc.uah.es/drg/courses/datamining/datasets.zip>

Checks the results for k Means using 3 clusters.

KnowledgeFlow

Visual running of experiments. Example of running J4.8 (C4.5)

The screenshot shows the Weka KnowledgeFlow Environment with a workflow diagram and a Text Viewer window displaying evaluation results.

Workflow Diagram:

Kappa statistic	0.0424	
Mean absolute error	0.1757	
Root mean squared error	0.3301	
Relative absolute error	98.2132 %	
Root relative squared error	110.822 %	
Coverage of cases (0.95 level)	95.7831 %	
Mean rel. region size (0.95 level)	83.1325 %	
Total Number of Instances	498	

=== Detailed Accuracy By Class ===

	TP Rate	FP Rate	Precision	Recall	F-Measure	ROC Area
Weighted Avg.	0.969	0.939	0.904	0.969	0.935	0.558
	0.061	0.031	0.176	0.061	0.091	0.558
	0.88	0.849	0.833	0.88	0.852	0.558

=== Confusion Matrix ===

a	b	<-- classified as
435	14	a = false
46	3	b = true

Status Log:

Component	Parameters	Time	Status
KnowledgeFlow		0:00	OK
ArffLoader		-	Finished.
CrossValidation		-	Finished.
ClassifierPerformanceBatchClassifier	-C 0.25 -M 2	-	Finished.

Experimenter

Allow us to compare multiple algorithms

Typically, 10 times 10-CV

The screenshot shows the 'Weka Experiment Environment' window with the 'Setup' tab selected. The interface is divided into several sections:

- Experiment Configuration Mode:** Two radio buttons, 'Simple' (selected) and 'Advanced'.
- Buttons:** 'Open...', 'Save...', and 'New'.
- Results Destination:** A dropdown menu set to 'ARFF file', a text field for 'Filename' containing 'experimenterExample', and a 'Browse...' button.
- Experiment Type:** A dropdown menu set to 'Cross-validation', a text field for 'Number of folds' containing '10', and two radio buttons, 'Classification' (selected) and 'Regression'.
- Iteration Control:** A text field for 'Number of repetitions' containing '10', and two radio buttons, 'Data sets first' (selected) and 'Algorithms first'.
- Datasets:** A list of datasets: 'datasets/cm1.arff', 'datasets/kc1.arff' (highlighted), and 'datasets/kc2.arff'. Above the list are buttons 'Add new...', 'Edit sele...', and 'Delete se...'. A checkbox 'Use relative...' is checked. Below the list are 'Up' and 'Down' buttons.
- Algorithms:** A list of algorithms: 'ZeroR', 'J48 -C 0.25 -M 2', 'Logistic -R 1.0E-8 -M -1', and 'NaiveBayes'. Above the list are buttons 'Add n...', 'Edit select...', and 'Delete sele...'. Below the list are buttons 'Load optio...', 'Save optio...', '...', and 'D...'. A 'Notes' section is at the bottom.

Experimenter – Output

After Running the experiment (Run tab) and loading the generated file (Analyze tab)

The screenshot shows the 'Weka Experiment Environment' window with the 'Analyze' tab selected. The 'Source' section indicates 'Got 1200 results'. The 'Configure test' section on the left shows the following settings: 'Testing with' is 'Paired T-Tester (corrected)', 'Comparison field' is 'Area_under_ROC', 'Significance' is '0.05', 'Sorting (asc.) by' is '<default>', 'Test base' is 'Select', 'Displayed Columns' is 'Select', 'Show std. deviations' is checked, and 'Output Format' is 'Select'. The 'Test output' section on the right displays the following information:

Tester: weka.experiment.PairedCorrectedTTTester
Analysing: Area_under_ROC
Datasets: 3
Resultsets: 4
Confidence: 0.05 (two tailed)
Sorted by: -
Date: 02/05/12 21:06

The results table shows the Area_under_ROC for four datasets across three resultsets (CM1, KC1, KC2). The table is as follows:

Dataset	(1) rules.ZeroR	(2) trees.J48	(3) functions.	(4) bayes.Naiv
CM1	(100) 0.50(0.00)	0.56(0.13)	0.78(0.11) v	0.74(0.10) v
KC1	(100) 0.50(0.00)	0.70(0.07) v	0.80(0.04) v	0.79(0.04) v
KC2	(100) 0.50(0.00)	0.69(0.10) v	0.82(0.08) v	0.84(0.06) v

The table also includes a summary row at the bottom: (v/ /*) | (2/1/0) (3/0/0) (3/0/0).

The 'Key' section at the bottom right provides the following information:

Key:
(1) rules.ZeroR '' 48055541465867954
(2) trees.J48 '-C 0.25 -M 2' -21773316839364444
(3) functions.Logistic '-R 1.0E-8 -M -1' 3932117032546553727
(4) bayes.NaiveBayes '' 5995231201785697655

The 'Result list' section at the bottom left shows the following results:

- 21:06:31 - Area_under_ROC - rules.ZeroR '' 48055541
- 21:06:40 - Available resultsets
